

PRODUCT DESCRIPTION

Evencure AA Evaporation Retardant prevents hot and windy weather from causing newly poured concrete to bleed and evaporate. Hot weather can rather quickly cause fresh concrete to bleed and evaporate, making it hard to determine the correct time to finish the surface. Aliphatic Alcohol Evaporation Retardant is a water-based finishing compound which controls the evaporation of bleed water, thus improving the quality of the concrete surface.

BENEFITS

- Water based
- Environmentally friendly
- Controlled water evaporation dramatically improves the quality of the concrete
- Reduces the chance of dusting
- Reduces plastic shrinkage
- Eliminates the need for extra water during hot weather pours

AREAS OF APPLICATION

Evencure AA Evaporation Retardant is suitable for curing all freshly laid concrete either smooth or textured, indoors or outdoors.

PROPERTIES

Form	Liquid
Colour	Green
Odour	Product specific
Boiling point	>100°C
Flash point	Not flammable
	A flash point determination is unnecessary due to the high water content
Lower explosion limit	N/A
Upper explosion limit	N/A
Explosion hazard	Not explosive
Fire promoting properties	Not fire-propagating
Vapour pressure	N/A
Density	1.08 g/cm ³
	(20°C)
Bulk density	N/A
